The Need: From Intake to Wellness Journey

Clients may not know muscle names. Free and paid services are not clearly separated, intake data arrives through EmailJS, and MedBridge follow-up is manual.

Purpose: help clients identify pain, select the right service, pay when required, schedule, and continue into guided follow-up.

Users, Stakeholders & Success

Users

Clients seeking accessible pain and movement support.

Stakeholders

Clients, sponsor/business owner, capstone team, and service providers.

Success

A clear mobile journey that supports paid services without automated diagnosis.

What Exists Today

- Static HTML, CSS, and JavaScript
- Three.js 3D body map and search
- In-browser MediaPipe movement scans
- EmailJS intake delivery
- Calendly scheduling
- Prior BigCommerce deployment

Proposed Phase 2 Scope

PROPOSED

Body-area-first selection; clearer free/paid scheduling; organized client-data workflow; MedBridge handoff; reusable QR intake.

Out of scope: automated diagnosis or exercise prescription.

Prerequisite: data integrating and scalability with database. Moving away from just sending email

01

Body area → muscles
Simplify selection and add education.

02

Service → pay → schedule
Define the free and paid journey and Stripe Integration

03

Data → follow-up
Improve sponsor workflow, MedBridge, and QR access.

Architecture: Decided vs. Investigating

DECIDED

Web-first, mobile-friendly; preserve useful inherited features; browser-based video processing; sponsor retains clinical decisions.

INVESTIGATING

Static vs. backend/database; payment integration with Stripe + Calendly pattern; privacy and retention; MedBridge options; accessibility and 3D performance.

Engineering & Quality Strategy

Baseline: reproducible local run and documented current behavior.

Tests: form validation, slider, map/search, EmailJS, Calendly, camera, and rep counting.

Workflow: Issue → branch → PR → review → test evidence → merge.
Add branch ruleset to github so main branch is preserved

Done: criteria met, tests pass, responsive/accessibility checked, docs updated, sponsor demo completed.

Risks & Dependencies

- Exploring database options and table schemas
- Payment/Calendly capabilities and fees
- BigCommerce constraints
- Exploring MedBridge access and API limits

Questions for the Sponsor

01

What are the exact paid offerings, prices, and payment timing?

02

What client data should be stored—and for how long?

03

Which MedBridge handoff, body areas, and success metrics come first?

Current Demo
